

BATHROOM		Notes
	<p>Toilet</p> <p>Inspect the toilet(s) carefully. Does the bowl seal properly? Does the bowl trap open appropriately when depressing the foot control or activating the electronic flush control?</p>	
	<p>Signs of leaks</p> <p>Pay particular attention in the RV bathroom for signs of leaks or damage. Does the floor feel mushy near the toilet? Any signs of discoloration? Check carefully around the shower fixture and vanity for leaks. Look inside the vanity for signs of leaks.</p>	
	<p>Sink and vanity, caulk</p> <p>Is the bathroom sink and vanity appropriately caulked and sealed?</p>	
	<p>Sink faucet</p> <p>Test the vanity faucet. Does the faucet work properly? Is there appropriate water pressure?</p>	
	<p>Shower</p> <p>Inspect the RV shower (tub if equipped) for any signs of damage. Apply pressure to the floor of the shower to see if there are any cracks in the enclosure. For showers with glass (or glass-like) sliding doors, do the doors have a locking mechanism for traveling?</p>	
	<p>Shower faucet</p> <p>Test the shower faucet. Does the faucet work properly? Is there appropriate water pressure?</p>	
	<p>Drains</p> <p>Monitor the drains while using each faucet. Do the drains run smoothly? Do any drains run slowly? Any smells from the drains?</p>	

	<p>Skylight</p> <p>Many RV showers have a skylight which aside from offering some natural light, allows additional headroom. These skylights are often a source of water infiltration. Carefully check the seal of the skylight for indication of leaks. Are there any signs of damage or cracks?</p>	
	<p>Washer/Dryer</p> <p>If equipped, check these connections. Inspect the water connections. Inspect the dryer vent for proper seal and operation. Remember, if equipped, this represents an additional winterization step. If included, check the washer/dryer for proper operation. Does the washer fill when operated? Does the dryer get warm after one minute of operation? Are the manuals included?</p>
