

SAFETY		Notes
	<p>Fire extinguishers</p> <p>Check the coach for fire extinguishers. Ideally, there should be a fire extinguisher immediately available in the kitchen area, the main entrance door and one immediately available in the bedroom area. Are the extinguishers within their indicated service dates? Does the mounting hardware work properly by allowing the extinguisher to be removed with minimal effort?</p>	
	<p>Smoke detectors</p> <p>Test each smoke detector. If the units are battery only, consider installing new batteries and annotating the date on a maintenance schedule to remind you to change the batteries annually.</p>	
	<p>LP gas detector</p> <p>Some RV units may have an emergency, gas flow shut off valve that is wired to a LP gas detector in the coach. In the event LP gas was detected, the valve should close.</p>	
	<p>CO detector</p> <p>Check the CO detector. Units should have a test function. If combined with a smoke detector unit, follow the test instructions in the owner's manual. If the unit is battery only, consider installing new batteries.</p>
